

CANARY.EARTH

Vision

In 2023, Hawaii wildfires killed over 100 people. Many never received timely alerts. Weeks later, Toronto choked on wildfire smoke, yet no simple device existed to tell you what you were breathing.

That was my wake-up call.

The problem is invisible. Everyday environments, from bedrooms to boardrooms, are flooded with pollutants like fine particulate matter, cognitive-draining carbon dioxide (CO₂), and allergens. Peer-reviewed studies show CO₂ levels above 1,400ppm can reduce cognitive performance by 15 - 25%. Yet the average person walks into a stuffy meeting room and blames themselves for the brain fog.

The solution is Canary. A pocketable environmental wellness monitor that makes the invisible visible. Using seven lab-grade sensors (true UV-B, laser-acoustic CO₂, dual-laser particle counter, temperature, humidity, pressure and luminosity), Canary shows real-time data and the 24-hour trend on an elegant e-paper screen. It alerts you before danger peaks with a beep or a pulse of light. No phone required. No subscription needed.

Bottom line: Peace of mind, better sleep, and the ability to act before danger arrives.

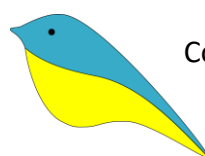

Market Opportunity

Post-pandemic awareness of indoor air quality, increasing wildfire smoke, and lengthening allergy seasons have created strong demand for personal environmental monitoring. The North American air quality monitoring market is valued at \$1.49 billion USD (2025), with the portable consumer segment estimated at over \$200 million and growing rapidly.

Primary Customers (B2C): Health-conscious professionals, parents, individuals with asthma or allergies, and avid life-loggers part of the *Quantified Self* movement.

Secondary Customers (B2B): Schools, offices, property managers and HVAC contractors needing reliable data for compliance and for occupant wellness.

Competitive landscape: Existing solutions are fragmented and inadequate. *Aranet4* is CO₂-only and phone-dependent. *PurpleAir* is bulky and PM-only. *Awair* and *Airthings* rely on estimated or lower-accuracy sensors and often require subscriptions or lack portability. No current device combines accuracy, on-device graphing, weeks of battery life, and repairability at a consumer price point. Canary's unique features - Scanner Mode, Mask Test, Sunscreen Buddy, Flight Mode, Postcards, Clock, Stock Ticker - further differentiate it in the portable, proactive segment.

Demand validation: Our comprehensive feedback form (200+ useful responses) showed 24% of respondents want to buy two units, and they would pay an extra \$50 for accessories. Early posts on Reddit and X generated organic traction, including a mention by *BlogTO*.

Business Model

B2C hardware sales: Direct-to-consumer at \$249 to \$299 USD per unit. Gross margin projected to be 75% at scale (COGS, at most, \$65 all included).

B2B sales and subscriptions: Schools and offices pay monthly for networked monitoring, dashboard access and cloud storage. Or a one-time setup fee for their own local servers.

Go-to-market strategy:

Phase 1 (July): Pre-launch waitlist via canary.earth; build email list through content marketing (Instagram Reels, X, Reddit) and partnerships (GO AQS, Clean Air Toronto).

Phase 2 (August): Kickstarter crowdfunding campaign to raise initial capital, and to secure the first 400 backers.

Phase 3 (September): First production run of 2,000 units and direct-to-consumer sales.

Phase 4 (2027): Scale to retail partnerships; B2B and B2G sales teams.

Executive Team

Constantin Bucataru, BBA (Schulich School of Business) - Founder and CEO. Designed and built functional prototype (TRL 7) operating reliably 24/7 for over two consecutive years.

Engineering and Firmware Team: Supported by two specialized contract engineers (M.Eng. and M.Sc.) managing Design for Manufacturing and Assembly (DFM&A).

Key hires post-seed: Chief Financial Officer (CFO) and an Overseas Operations Manager.

Resources Needed

\$100,000 seed funding for preliminary FCC/ISED/CE certification (\$20k), marketing and crowdfunding campaign, including promotional video (\$20k), accelerated tooling and injection moulding design (\$20k), working capital and contingencies (\$40k).

Non-dilutive support: Sales partnerships, Board of Directors additions, and sage mentorship advice concerning outsourcing, consumer electronics, government procurement and best practices.
